

How to remotely access your personal files and the project server files using a Mac

NOTE:

You must use Safari or Netscape Browsers to perform these steps

I. Currently MAC OS 10.3.X does not support webDAV over HTTPS in the finder so a client that does support this feature must be used. A client available from webDAV.org should be downloaded to use this feature. [Click here to download the Goliath Client](#). After you download the client you can use it the same way you use the finder. The Goliath client has a good help feature to assist you in creating connections.

II. The connections you should create for various types of access are as follows:

On the web browser, enter any of the URL address listed below for the particular file you want to access

For your Personal Files:

For faculty and staff: <https://sra.saud.ku.edu/faculty/username>

For students: <https://sra.saud.ku.edu/students/username>

where [username](#) is your own SAUD account name

For Project Server Files:

<https://sra.saud.ku.edu/projects/>

III. You will be prompted to enter your School of Architecture login and password (These are the login and password you type in when you log in to your computer when in the School of Architecture building)

IV. After entering login and password, you will now see the folders you want to view, update or add files on.
